Esri geodatabase data model templates

The availability of a practical and up-to-date data model template, tailored to the unique needs of an industry, is one of the keys to a successful GIS implementation, whether one's use of Esri software is new or long-standing. For this reason, Esri collaborates with industry and academic leaders to continually evolve a range of geodatabase data model templates. The intent of Esri data model templates is to provide users with a best practice, industry-specific starting point. Most users start with these data model templates; then they refine and extend them to meet their specific needs and requirements. Esri data model templates work with the ArcGIS platform and reflect Esri's view of best data model practice.

The **ArcGIS Railroads Data Model** is a geodatabase data model template for organizations that operate in the railroad industry, or in industries that operate with railroad-based operations and assets. It is a moderately normalized data model, intended to digitally represent physical and non-physical aspects of railroad operations.

Esri thanks all those professionals and organizations who contributed their time and talents to the creation and improvement of the **ArcGIS Railroads Data Model** for the good of the community and of all Esri users in the Railroad industries.

Goal of the ArcGIS Railroads Data Model

The goal of the **ArcGIS Railroads Data Model** is to make it easier, quicker, and more cost-effective for Railroad organizations to implement the ArcGIS system. The Esri provided data model template accomplishes this by freely providing a data model that takes full advantage of the capabilities of the geodatabase. The data model is created and tested with ArcGIS products to ensure that it works. This significantly reduces the complexity, time, and cost to implement a spatially enabled Railroads data repository.

Keeping up with the advancements of the geodatabase is an ongoing activity. Esri software development staff continue to enhance and evolve the capabilities of the geodatabase. In addition to the data model representing a best practice on how to leverage the geodatabase, the data model also represents a repository of industry knowledge. Much of the

structure and content of this data model is based on feedback from Esri's users as well as lessons learned from the large number of implementations of ArcGIS in the railroads industries.

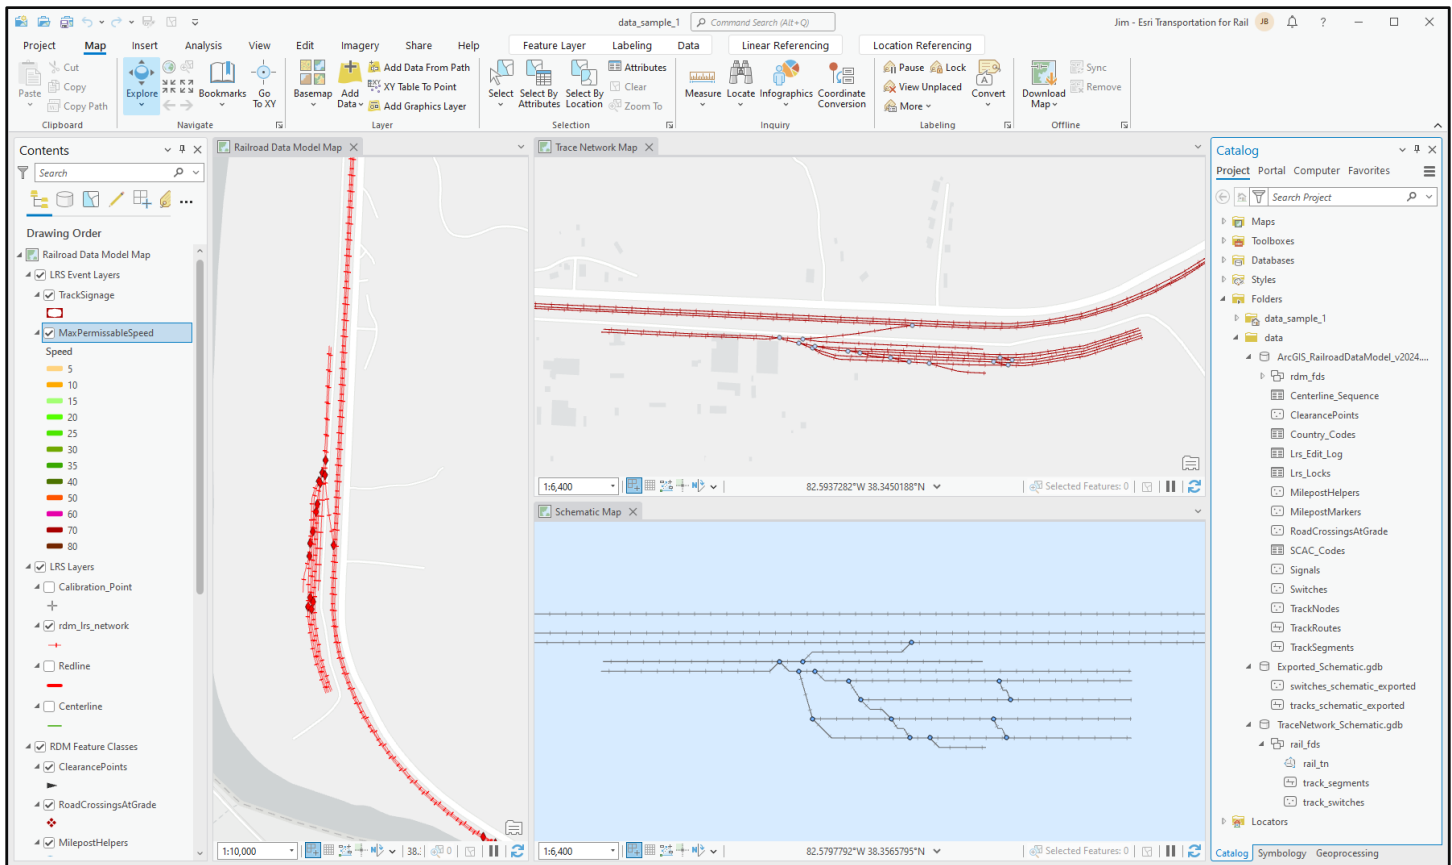

Because the **ArcGIS Railroads Data Model** is built specifically for the ArcGIS family of products, it can be implemented as-is, without modification to ArcGIS products.

Audience

At this 2025 edition of the data model, the primary target audience are freight railroad organizations across North America.

Passenger rail organizations in North America, as well as all kinds of rail organizations in the world outside of North America have many significant differences in their assets, operations, as well as requirements and constraints that are specific to different countries and regions. That isn't to say that for those other organizations this data model would be useless. These other kinds of rail organizations may find valuable use from this data model as a starting point, or as a resource for enhancing their own database design.

It is simply important to recognize that for organizations other than North American railroads, this version of the data model has not comprehensively considered their needs. We welcome partners and other organizations would would like to collaborate with Esri for improving and extending this data model further, to broaded its scope for future versions.

Design Considerations

The ArcGIS Railroads Data Model has two sets of design considerations:

1. **INDUSTRY COMPATIBILITY** -- The ArcGIS Railroads Data Model needs to be fully compatible with other industry standard data models that already exist and are in productive use across the railroad industry. This is important for both interoperability purposes as well as making data exchange and translation easier. To that end, this ArcGIS Railroads Data Model includes elements of, and is fully compatible with:
 - a. **North American Rail Network (NARN) database model:** Maintained and published by the US Department of Transportation's Federal Railroad Administration.
 - b. **Positive Train Control (PTC) database model:** This is a set of technologies implemented to prevent some of the most major human-error incidents such as train-to-train collisions, over-speed derailments, incursions into established work zone limits, and the movement of trains thru a mainline switch left in the wrong position. PTC accomplishes these objectives in part with a database model for storing and updating data (including spatial data) in a standard and useful way. This database model is also governed by the US Department of Transportation's Federal Railroad Administration.
 - c. **Rail Industry Geographic Information System (RIGIS™) database model:** Maintained and published by Railinc, which is a wholly owned, for-profit subsidiary of the Association of American Railroads (AAR). Railinc is a resource for technology solutions used by railroads across North America. RIGIS™ is the data model used by these railroads when sharing data with other railroads or updating their data with Railinc/AAR to support a wide variety of collective uses.
2. **GIS CAPABILITIES** -- The ArcGIS Railroads Data Model needs to contain design elements that allow railroad data to fully exploit the capabilities of the ArcGIS system, to include:
 - a. Linear Referencing--specifically using ArcGIS Location Referencing tools.
 - b. Network datasets--for solving best paths, service areas, and other network analysis capabilities.
 - c. Trace Networks--for topological validation and all types of network tracing functions.
 - d. Network Diagrams--for schematic mapping and supporting track chart creation and update.
 - e. Straight-Line Diagrams--for mapping point and span data of assets and phenomena.
 - f. Field Mobility--for asset inspection, incident reporting, maintenance of way operations, and more.
 - g. Real-Time mapping--of vehicles, personnel, and stationary sensors.
 - h. Parcel maintenance--as a base for managing real estate property, structures, and other assets.
 - i. Artificial Intelligence--for building and using deep learning models for automating data collection.

The Railroads 2025 Edition Geodatabase

The feature classes and tables that comprise the Railroads 2025 Edition Geodatabase are listed below.

Geodatabase Feature Classes

TrackSegments

Purpose: Each segment represent a pair of steel rails constituting one track.

Feature Class Schema

This is the schema for the *TrackSegments* feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain
Shape	Shape	PolylineZM	0	0	0	
ObjectId	Object ID	long	0	10	0	
Guid	Guid	Guid	38	0	0	
SCAC	Owner SCAC	text	4	0	0	SCACCode
DIVISION	Division	text	50	0	0	
SUBDIV	Subdivision	text	50	0	0	
SubdivisionId	Subdivision ID	short	0	4	0	
SegmentId	Segment ID	long	0	9	0	
NetAttribs	Network Attributes	long (nullable)	0	9	0	
TimetableOrientation	Timetable Orientation	text	1	0	0	
TrackName	Track Name	text	32	0	0	
TrackQualifier	Track Qualifier	text	50	0	0	
RouteName	Route Name	text	100	0	0	
RouteId	Route ID	Guid	38	0	0	
Prefix	Milepost Prefix	text	5	0	0	
Suffix	Milepost Suffix	text	5	0	0	
BeginNodeId	Begin Node ID	text	50	0	0	
BeginNodeSCAC	Begin Node SCAC	text	4	0	0	SCACCode
BeginNodeType	Begin Node Type	text	25	0	0	NodeTypeCode
BeginBoundaryType	Begin Boundary Type	text	25	0	0	BoundaryTypeCode
FromMilepostPrefix	From Milepost Prefix	text	5	0	0	
BeginMilepost	Begin Milepost	double	0	10	4	
FromMilepostSuffix	From Milepost Suffix	text	5	0	0	
EndNodeId	End Node ID	text	50	0	0	
EndNodeSCAC	End Node SCAC	text	4	0	0	SCACCode
EndNodeType	End Node Type	text	25	0	0	NodeTypeCode
EndBoundaryType	End Boundary Type	text	25	0	0	BoundaryTypeCode
ToMilepostPrefix	To Milepost Prefix	text	5	0	0	
EndMilepost	End Milepost	double	0	10	4	
ToMilepostSuffix	To Milepost Suffix	text	5	0	0	

CrossoverFlag	Crossover Flag	text	1	0	0	CrossoverFlagCode
FRAARCID	FRA Arc ID	long	0	10	0	
FRFRANODE	From FRA Node	long	0	10	0

Create Date Field	created_date

Update Editor Field	last_edited_user
Update Edit Date Field	last_edited_date

Attributes:

Field Name – Field description (source compatibility)

Shape - A single-part PolylineZM with M values that increase in the digitized direction. (GIS)

OBJECTID - Assigned by the GIS. (GIS)

Guid - Globally unique identifier, 128-bits (16 bytes). (GIS, RIGIS)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN, RIGIS)

DIVISION – Division in which this segment resides. (NARN)

SUBDIV – Subdivision in which this segment resides. (NARN)

SubdivisionId – Id of the subdivision containing the segment. (PTC, RIGIS)

SegmentId – 9-digit segment ID unique within the subdivision. (PTC)

NetAttribs – Network attributes for supporting network diagramming and schematic mapping. (GIS)

TimetableOrientation – Direction of milepost increase: N S E W. (PTC)

TrackName – Describes which track this segment contains. (PTC, RIGIS)

TrackQualifier – Element that makes the route_name unique. (RIGIS)

RouteName – Name of the route of which this segment is a part, to support LRS. (GIS, RIGIS)

Routeld – Guid of the route of which this segment is a part, to support LRS. (GIS)

Prefix – Milepost modifiers, if they exist. (PTC)

Suffix – Milepost modifiers, if they exist. (PTC)

BeginNodeId – Node Id connected to the low MP end of the segment. (PTC)

BeginNodeSCAC – SCAC corresponding to the begin node. (PTC)

BeingNodeType – Type of node connected to the start of the segment. (PTC)

BeginBoundaryType – Type of boundary at the start of the segment. (PTC)

FromMilepostPrefix – Milepost modifiers for all mileposts in the segment, else blank. (RIGIS)

BeginMilepost – Milepost value at the start of the segment. (PTC)

FromMilepostSuffix – Milepost modifiers for all mileposts in the segment, else blank. (RIGIS)

EndNodeId – Node Id connected to the high MP end of the segment. (PTC)

EndNodeSCAC – SCAC corresponding to the end node. (PTC)

EndNodeType – Type of node connected to the end of the segment. (PTC)

EndBoundaryType – Type of boundary at the end of the segment. (PTC)

ToMilepostPrefix – Milepost modifiers for all mileposts in the segment, else blank. (RIGIS)

EndMilepost – Milepost value at the end of the segment. (PTC)

ToMilepostSuffix – Milepost modifiers for all mileposts in the segment, else blank. (RIGIS)

CrossoverFlag – Indicates whether or not this segment is a crossover piece of track: Y or N. (PTC)

FRAARCID – FRA-assigned primary key of the segment as stored in the NARN. (NARN)

FRFRANODE – Id of the from node as stored in the NARN. (NARN)

TOFRANODE – Id of the to node as stored in the NARN. (NARN)

STFIPS – Fips code of the US state the segment resides in. (NARN)

CNTYFIPS – Fips code of the US country the segment resides in. (NARN)

STCNTYFIPS – Concat of the STFIPS and CNTYFIPS values. (NARN)

STATEAB – Two character abbreviation of the US state the is segment resides in. (NARN)

COUNTRY – Two character abbreviation of the country the segment resides in. (NARN)

FRADISTRICT – FRA district in which the segment resides: 1-8 for US, and 99 outside US. (NARN)

RROWNER1 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that owns the track. (NARN)

RROWNER2 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad track co-owner. (NARN)

RROWNER3 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad track co-owner. (NARN)

TRKRIGHTS1 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that has track rights. (NARN)

TRKRIGHTS2 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that has track rights. (NARN)

TRKRIGHTS3 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that has track rights. (NARN)

TRKRIGHTS4 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that has track rights. (NARN)

TRKRIGHTS5 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that has track rights. (NARN)

TRKRIGHTS6 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that has track rights. (NARN)

TRKRIGHTS7 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that has track rights. (NARN)

TRKRIGHTS8 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that has track rights. (NARN)

TRKRIGHTS9 – 2-4 character Standard Carrier Alpha Code (SCAC) for the railroad that has track rights. (NARN)

BRANCH – Branch name if it exists. (NARN)

YARDNAME – Yard name if it exists. (NARN)

PASSNGR – The type of passenger service on the segment. (NARN)

STRACNET – Strategic rail corridor. (NARN)

NET – Type of track using the NetTrackType domain. (NARN, RIGIS)

TrackStatus – Identifies if the track segment is active or otherwise. (NARN)

MILES – Length of the segment in miles. (NARN)

KM – Length of the segment in kilometers. (NARN)

TIMEZONE – Time zone that the track segment resides within: E, C, M, P, K, H, Z. (NARN)

ShapeSTLength – Length of the segment in meters. (NARN)

Shape_Length – Length in spatial reference units (for NARN is decimal degrees). (NARN)

TrackNodes

Purpose: Track Nodes are point features that represent the start and end nodes of each track segment. Each track segment must start and end with a node, and nodes may not appear anywhere else within or outside of a track segment line.

Feature Class Schema

This is the schema for the *TrackNodes* feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain

Editor Tracking Value	Attribute Name
Creator Field	created_user
Create Date Field	created_date
Update Editor Field	last_edited_user
Update Edit Date Field	last_edited_date

Attributes:

Field Name – Field description (source compatibility)

Shape - A single-part PointZM. (GIS)

OBJECTID - Assigned by the GIS. (GIS)

Guid - Globally unique identifier, 128-bits (16 bytes). (GIS, RIGIS)

NodeId – ID of the track node (GIS, RIGIS, NARN)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN, RIGIS)

DIVISION – Division in which this segment resides. (NARN)

SubdivisionId – Id of the subdivision containing the segment. (PTC, RIGIS)

NodeType – The reason for the addition of the node.

Latitude – Latitudinal location of the node, WGS 1984. (PTC)

Longitude – Longitudinal location of the node, WGS 1984. (PTC)

Elevation – Elevation in feet above mean sea level at the node's location. (PTC)

Description – Human readable description of the node. (PTC)

FacingSCAC – Railroad ID of the facing segment. (PTC)

FacingSubdivisionId – Subdivision ID of the facing segment. (PTC)

FacingSegmentId – Segment ID of the facing segment. (PTC)

NormalSCAC – Railroad ID of the normal segment. (PTC)

NormalSubdivisionId – Subdivision ID of the normal segment. (PTC)

NormalSegmentId – Segment ID of the normal segment. (PTC)

ReverseSCAC – Railroad ID of the reverse segment. (PTC)

ReverseSubdivisionId – Subdivision ID of the reverse segment. (PTC)

ReverseSegmentId – Segment ID of the reverse segment. (PTC)

FRANODEID – ID of the node as stored in the NARN. (NARN)

COUNTRY – Two character abbreviation of the country in which the node resides. (NARN)

STATE – Two character abbreviation of the state in which the node resides. (NARN)

STATEFIPS – State FIPS code for the state in which the node resides. (NARN)

CNTYFIPS – County FIPS code for the county in which the node resides. (NARN)

STCYFIPS – State and County FIPS for the county in which the node resides. (NARN)

FRADISTRICT – FRA District in which the node resides. (NARN)

PASSNGR – Passenger code. (NARN)

PASSNGRSTA – Passenger station description (NARN)

BNDRY – Unknown, but domain values are 0, 1, 2, 3 (NARN)

Switches

Purpose: Switches are devices that allow trains to be guided from one track to another, for example, when a train traveling on a single track approaches a switch where the single line splits into two tracks, and the train can be guided onto one or the other. Some switches are more complex than that, allowing for one or more inputs and one or more outputs.

Feature Class Schema

This is the schema for the *Switches* feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain

Editor Tracking Value	Attribute Name
Creator Field	created_user
Create Date Field	created_date
Update Editor Field	last_edited_user
Update Edit Date Field	last_edited_date

Attributes:

Field Name – Field description (source compatibility)

Shape - A single-part PointZM. (GIS)

OBJECTID - Assigned by the GIS. (GIS)

Guid - Globally unique identifier, 128-bits (16 bytes). (GIS, RIGIS)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN, RIGIS)

SwitchDirection – Orientation of the switch: left face, right face, left rear, right rear (PTC, RIGIS)

SwitchName – User-readable name assigned to the switch. (PTC)

SiteName – The site to which the switch belongs. (PTC)

SiteDeviceId – The device ID of the switch as it is identified with respect to the specified site. (PTC)

WIUAddress – The WIU used to get the status of the switch. (PTC)

WIUStatusIndex – The location of the switch data in the status message. (PTC)

SpringSwitchType – If it's a spring switch, what kind and in what direction, or if it's a non-spring switch. (PTC)

MonitoredStatus – Whether or not the switch is monitored by some kind of active communication. (PTC)

FacingSwitchProtection – Whether or not the switch has protection, and if so, which kind. (PTC)

NormalSwitchProtection – Whether or not the switch has protection, and if so, which kind. (PTC)

ReverseSwitchProtection – Whether or not the switch has protection, and if so, which kind. (PTC)

RouteNameFacing – Route name of the track facing into the switch.

RouteNameNormal – Route name of the track the switch moves toward in normal position.

RouteNameReverse – Route name of the track the switch moves toward in reverse position.

MilepostPrefixFacing – If the facing milepost has a prefix.

MilepostNumberFacing – Milepost of the switch on the facing track leading into the switch.

MilepostSuffixFacing – If the facing milepost has a suffix.

MilepostPrefixNormal – If the normal milepost has a prefix.

MilepostNumberNormal – Milepost of the switch on the normal track thru the switch.

MilepostSuffixNormal – If the normal milepost has a suffix.

MilepostPrefixReverse – If the reverse milepost has a prefix.

MilepostNumberReverse – Milepost of the switch on the reverse track thru the switch.

MilepostSuffixReverse – if the reverse milepost has a suffix.

TurnoutDirectionReverse – The position of the reverse track relative to the increasing milepost direction, left or right.

CalibrationPointFlag – Y/N flag indicates whether or not a switch point is also a calibration point for LRS.

SubdivisionId – The subdivision ID in which the switch resides.

Latitude – Latitude in decimal degrees, WGS 1984, where the switch is located.

Longitude – Longitude in decimal degrees, WGS 1984, where the switch is located.

Elevation – Elevation in feet above mean sea level, at which the switch is located.

TrackRoutes

Purpose: Track routes consist of groups of TrackSegment features, where each route feature consists of all segments that share the same RouteName/RouteId. This TrackRoutes feature class forms the basis of the Centerlines feature class created as part of a linear referencing system.

Feature Class Schema

This is the schema for the *TrackRoutes* feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain
Shape	Shape	PointZM				
ObjectId	Object ID	long	0	10	0	
Guid	Guid	guid	38	0	0	
SCAC	Owner SCAC	text	4	0	0	SCACCode
SubdivisionId	Subdivision ID	short	0	4	0	
RouteName	Route Name	text	100	0	0	
RouteId	Route ID	Guid	38	0	0	
TrackName	Track Name	text	255	0	0	
TrackQualifier	Track Qualifier	text	50	0	0	
TrackType	Track Type	text	25	0	0	TrackTypeCode
FromMilepostPrefix	From Milepost Prefix	text	5	0	0	
BeginMilepost	Begin Milepost	double	0	10	4	
FromMilepostSuffix	From Milepost Suffix	text	5	0	0	
ToMilepostPrefix	To Milepost Prefix	text	5	0	0	
EndMilepost	End Milepost	double	0	10	4	
ToMilepostSuffix	To Milepost Suffix	text	5	0	0	

GeometryType: Polyline ZM

Relationships: None

Attachments: No

Editor Tracking: Yes

Editor Tracking Value	Attribute Name
Creator Field	created_user
Create Date Field	created_date
Update Editor Field	last_edited_user
Update Edit Date Field	last_edited_date

Attributes:

Field Name – Field description (source compatibility)

Shape - A single-part PolylineZM with M values that increase in the digitized direction. (GIS)

OBJECTID - Assigned by the GIS. (GIS)

Guid - Globally unique identifier, 128-bits (16 bytes). (GIS, RIGIS)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN, RIGIS)
SubdivisionId – Id of the subdivision containing the segment. (PTC, RIGIS)
RouteName – Name of the route of which this segment is a part, to support LRS. (GIS, RIGIS)
RouteId – Guid of the route of which this segment is a part, to support LRS. (GIS)
TrackName – Describes which track this segment contains. (PTC, RIGIS)
TrackQualifier – Element that makes the route_name unique. (RIGIS)
TrackType – The route’s track function (main, siding, yard, etc) (RIGIS)
FromMilepostPrefix – Milepost modifiers for all mileposts in the segment, else blank. (RIGIS)
BeginMilepost – Milepost value at the start of the segment. (PTC)
FromMilepostSuffix – Milepost modifiers for all mileposts in the segment, else blank. (RIGIS)
ToMilepostPrefix – Milepost modifiers for all mileposts in the segment, else blank. (RIGIS)
EndMilepost – Milepost value at the end of the segment. (PTC)
ToMilepostSuffix – Milepost modifiers for all mileposts in the segment, else blank. (RIGIS)

Signals

Purpose: Signals visible to train operators that direct movement options.

Feature Class Schema

This is the schema for the *Signals* feature class.

Attributes:

Field Name – Field description (source compatibility)

Shape - A single-part PointZM. (GIS)

OBJECTID - Assigned by the GIS. (GIS)

Guid - Globally unique identifier, 128-bits (16 bytes). (GIS, RIGIS)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN, RIGIS)

SubdivisionId – Id of the subdivision containing the segment. (PTC, RIGIS)

SegmentId – 9-digit segment ID unique within the subdivision that the signal belongs. (PTC)

Latitude – Latitude in decimal degrees, WGS 1984, where the switch is located. (PTC)

Longitude – Longitude in decimal degrees, WGS 1984, where the switch is located. (PTC)

Elevation – Elevation in feet above mean sea level, at which the switch is located. (PTC)

GraphicType – Identifies which side of the track the signal is on, relative to increasing milepost. (PTC)

Milepost – The milepost location of the signal. (PTC)

SignalType – Defines the type of signal. (PTC)

SignalDirection – Defines whether the signal is visible to traffic in the direction of increasing milepost. (PTC)

SiteName – The site to which the signal belongs. (PTC)

SiteDeviceId – The device ID of the signal, as identified within its site. (PTC)

WIUAddress – The WIU used to get the status of the signal. (PTC)

WIUStatusIndex – The location of the signal data in the status message. (PTC)

MonitoredStatus – Defines whether the signal is monitored via peer-to-peer or office communication. (PTC)

SignalName – Unique name for the signal. (PTC)

PromptEnable – Defines whether prompting for authority to pass this signal at stop is enabled. (PTC)

PromptTime – Delay in seconds before on-board display displays a prompt to pass a signal at stop, and allows train to proceed in lieu of lock. (PTC)

MilepostMarkers

Purpose: Physical markers that display milepost values

Feature Class Schema

This is the schema for the *MilepostMarkers* feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain
Shape	Shape	PointZM

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN, RIGIS)

SubdivisionId – Id of the subdivision containing the segment. (PTC, RIGIS)

SegmentId – 9-digit segment ID unique within the subdivision that the mile marker belongs. (PTC)

Latitude – Latitude in decimal degrees, WGS 1984, where the mile marker is located. (PTC, RIGIS)

Longitude – Longitude in decimal degrees, WGS 1984, where the mile marker is located. (PTC, RIGIS)

Elevation – Elevation in feet above mean sea level, at which the mile marker is located. (PTC, RIGIS)

MilepostMeasure – The numeric milepost measured location that the mile marker represents. (PTC, RIGIS)

MilepostPrefix – The milepost prefix if any. (RIGIS)

MilepostLabel – The milepost's measured label displayed on the marker. (RIGIS)

MilepostSuffix – The milepost suffix if any. (RIGIS)

MilepostType – The type of the milepost. (RIGIS)

MilepostHelper

Purpose: This feature allows for a milepost value to be linked to a location on the track where a MilepostMarker feature does not physically exist. (from PTC, but in rigis would be called virtual milepost)

Feature Class Schema

This is the schema for the *MilepostHelper* feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain

Guid - Globally unique identifier, 128-bits (16 bytes). (GIS, RIGIS)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN, RIGIS)

SubdivisionId – Id of the subdivision containing the segment. (PTC, RIGIS)

SegmentId – 9-digit segment ID unique within the subdivision that the signal belongs. (PTC)

StreetName – The name of the street that crosses the rail line. (PTC)

DOTNum – Identification number assigned to the cross-street by DOT, if any. (PTC)

BeginMilepostMeasure – The numeric milepost measured location at the beginning of the width of the crossing. (PTC)

EndMilepostMeasure – The numeric milepost measured location at the end of the width of the crossing. (PTC)

BeginLatitude – Latitude in decimal degrees, WGS 1984, where the crossing begins. (PTC)

BeginLongitude – Longitude in decimal degrees, WGS 1984, where the crossing begins. (PTC)

BeginElevation – Elevation in feet above mean sea level, at where the crossing begins. (PTC)

EndLatitude – Latitude in decimal degrees, WGS 1984, where the crossing ends. (PTC)

EndLongitude – Longitude in decimal degrees, WGS 1984, where the crossing ends. (PTC)

EndElevation – Elevation in feet above mean sea level, at where the crossing ends. (PTC)

CrossingType – Type of the at-grade crossing (ie, public, private, pedestrian). (PTC)

HornDisable – ‘Y’ if horn is not to be used at this at-grade crossing, else ‘N’. (PTC)

ClearancePoints

Purpose: Location after the trailing leg of a switch that represents the point of clearance for traversing through the switch device.

Feature Class Schema

This is the schema for the *ClearancePoints* feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain
Shape	Shape	PointZM

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN, RIGIS)

SubdivisionId – The subdivision ID in which the switch resides. (PTC)

NodeId – The node linked to the switch associated with this clearance point. (PTC)

NodeSCAC – The SCAC railroad that owns the node that this clearance point is linked to. (PTC)

NormalReverseType – Which side of the switch, increasing measure direction, the clearance point is on. (PTC)

ClearingType – Type of clearing. (PTC)

Latitude – Latitude in decimal degrees, WGS 1984, where the clearance point is located. (GIS, PTC)

Longitude – Longitude in decimal degrees, WGS 1984, where the clearance point is located. (GIS, PTC)

Elevation – Elevation in feet above mean sea level, at which the clearance point is located. (GIS, PTC)

ClearanceName – Unique name given to this clearance point. (PTC)

LRS Event Layers

Important: Do **not** use the *Create Feature Class* tool to create the following layers. Instead, use the *Create LRS Event* tool. For more information about this, refer to Appendix B of the ArcGIS Railroads Data Model data dictionary.

Calibration_Point

Purpose: Points with measures that are used by the LRS to calibrate those measures onto the LRS Centerline features. This layer is created by the ArcGIS “Create LRS” tool. Fields below marked with asterisks (*) are created by ArcGIS when this feature class is created. The other fields, you can add yourself if you want them.

Feature Class Schema

This is the schema for the *MaxSpeed* event layer feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain
Shape*	Shape	PointZM				
ObjectId*	Object ID	long	0	10	0	
FromDate*	FromDate	date				
ToDate*	ToDate	date

Attributes:

Field Name – Field description (source compatibility)

Shape - A single-part PointZM. (GIS)

OBJECTID - Assigned by the GIS. (GIS)

FromDate – Date at which this calibration point became valid. (GIS)

ToDate – Date at which this calibration point was retired. (GIS)

NetworkId – ID value of the LRS Network that this calibration point applies to. (GIS)

RouteId – ID value of the route that this point will be used to calibrate measures. (GIS)

Measure – Route measure at this calibration point. (GIS, RIGIS)

Guid - Globally unique identifier, 128-bits (16 bytes). (GIS, RIGIS)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN, RIGIS)

SubdivisionId – Id of the subdivision containing the segment. (PTC, RIGIS)

CalibrationPointTypeCode – Type of calibration point (ie., milepost, equation, switch, etc.)

RouteName – Unique name of the route. (GIS, RIGIS)

Latitude – Latitude of calibration point. (GIS, RIGIS)

Longitude – Longitude of calibration point location. (GIS, RIGIS)

Elevation – Elevation of calibration point location. (RIGIS)

MaxPermissibleSpeed

Purpose: Linear event features which store time-bound line events that represent the maximum operational speed of railed vehicles. These max speed areas exclude permanent or temporary speed restrictions. Those are managed in the SpeedRestrictions layer. Fields below marked with asterisks (*) are created by ArcGIS when this feature class is created. The other fields, you can add yourself if you want them.

Feature Class Schema

This is the schema for the *MaxPermissibleSpeed* event layer feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain

Attributes:

Field Name – Field description (source compatibility)

Shape - A single-part PolylineZM, LRS-managed line event feature. (GIS)

OBJECTID - Assigned by the GIS. (GIS)

FromDate – Date at which this speed restriction became valid. (GIS)

ToDate – Date at which this speed restriction was retired. (GIS)

NetworkId – ID value of the LRS Network that this speed restriction applies to. (GIS)

FromMeasure – Route measure of the start of the speed restriction zone. (GIS)

ToMeasure – Route measure of the end of the speed restriction zone. (GIS)

RouteId – ID value of the route that this speed restriction applies to. (GIS)

GlobalId - Globally unique identifier, 128-bits (16 bytes). (GIS, RIGIS)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN)

SubdivisionId – Id of the subdivision containing the segment. (PTC, RIGIS)

SegmentId – 9-digit segment ID unique within the subdivision that the speed restriction belongs. (PTC)

RouteName – Name of the route of which this segment is a part, to support LRS. (GIS)

TrainType – Type of train that the speed restriction applies. (GIS, PTC)

Direction – Direction that the speed restriction applies, relative to increasing mileposts. (GIS, PTC)

Speed – The speed restriction in mph. (GIS, PTC)

BeginLatitude – Latitude in decimal degrees, WGS 1984, where the speed restriction begins. (PTC)

BeginLongitude – Longitude in decimal degrees, WGS 1984, where the speed restriction begins. (PTC)

BeginElevation – Elevation in feet above mean sea level, at where the speed restriction begins. (PTC)

EndLatitude – Latitude in decimal degrees, WGS 1984, where the speed restriction ends. (PTC)

EndLongitude – Longitude in decimal degrees, WGS 1984, where the speed restriction ends. (PTC)

EndElevation – Elevation in feet above mean sea level, at where the speed restriction ends. (PTC)

QualifierType – Whether the restriction is “head-end”, “restricted speed”, or “none” . (PTC)

RestrictionType – Whether the restriction applies generically, or based on tonnage or axle count. (PTC)

RestrictionParameter – Whatever the restriction type is, this value is the restriction measure (ie., tonnage, axle count). (PTC)

Operator – Comparison operator value to apply to the speed (ie., <, >, =, etc). (PTC)

TrackRule

Purpose: Linear events for assigning and storing operating rules over defined sections of track. Fields below marked with asterisks (*) are created by ArcGIS when this feature class is created. The other fields, you can add yourself if you want them.

Feature Class Schema

This is the schema for the *TrackRule* event layer feature class.

Attributes:

Field Name – Field description (source compatibility)

Shape - A single-part PolylineZM, LRS-managed line event feature. (GIS)

OBJECTID - Assigned by the GIS. (GIS)

FromDate – Date at which this track rule became valid. (GIS)

ToDate – Date at which this track rule was retired. (GIS)

NetworkId – ID value of the LRS Network that this track rule applies to. (GIS)

FromMeasure – Route measure of the start of the track rule. (GIS)

ToMeasure – Route measure of the end of the track rule. (GIS)

RoutelId – ID value of the route that this track rule applies to. (GIS)

GlobalId - Globally unique identifier, 128-bits (16 bytes). (GIS, RIGIS)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (PTC, NARN)

SubdivisionId – Id of the subdivision containing the segment. (PTC, RIGIS)

SegmentId – 9-digit segment ID unique within the subdivision that the track rule belongs. (PTC)

RouteName – Name of the route of which this segment is a part, to support LRS. (GIS)

BeginLatitude – Latitude in decimal degrees, WGS 1984, where the track rule begins. (PTC)

BeginLongitude – Longitude in decimal degrees, WGS 1984, where the track rule begins. (PTC)

BeginElevation – Elevation in feet above mean sea level, at where the track rule begins. (PTC)

EndLatitude – Latitude in decimal degrees, WGS 1984, where the track rule ends. (PTC)

EndLongitude – Longitude in decimal degrees, WGS 1984, where the track rule ends. (PTC)
EndElevation – Elevation in feet above mean sea level, at where the track rule ends. (PTC)
SignalAuthorityType – Whether the restriction is “head-end”, “restricted speed”, or “none” . (PTC)
FBARDirection – Whether the restriction applies generically, or based on tonnage or axle count. (PTC)
CabSignalType – Whatever the restriction type is, this value is the restriction measure (ie., tonnage, axle count). (PTC)
YardLimits – Comparison operator value to apply to the speed (ie., <, >, =, etc). (PTC)

CABSignalDropout

Purpose: Linear events that map out areas where cab signal indication is unavailable. Fields below marked with asterisks (*) are created by ArcGIS when this feature class is created. The other fields, you can add yourself if you want them.

Feature Class Schema

This is the schema for the *CADSignalDropout* event layer feature class.

EndElevation – Elevation in feet above mean sea level, where this type of ballast exists. (GIS)

BallastType – Type of railroad ballast used along this length, between FromDate and ToDate. (GIS)

Curvature

Purpose: Linear events that map out sections of railroad that have certain measured curvature. Curvature is measured as the angle created by the point at the FromMeasure, the point at the ToMeasure, and the point along the centerline of the track halfway between the FromMeasure and ToMeasure. Fields below marked with asterisks (*) are created by ArcGIS when this feature class is created. The other fields, you can add yourself if you want them.

Feature Class Schema

This is the schema for the *Curvature* event layer feature class.

Column Name	Field Alias	Type	Length	Precision	Scale	Domain

Attributes:

Field Name – Field description (source compatibility)

Shape - A single-part PolylineZM, LRS-managed line event feature. (GIS)

OBJECTID - Assigned by the GIS. (GIS)

FromDate – Date at which the sign was installed. (GIS)

ToDate – Date at which the sign was removed. (GIS)

NetworkId – ID value of the LRS Network of the sign's location. (GIS)

Measure – Route measure of the sign's location. (GIS)

RouteId – ID value of the route of the sign's location. (GIS)

GlobalId - Globally unique identifier, 128-bits (16 bytes). (GIS)

SCAC – SCAC (Standard Carrier Alpha Code) for owner railroad. (GIS)

SubdivisionId – Id of the subdivision of the sign's location. (GIS)

SegmentId – 9-digit segment ID unique within the subdivision of the sign's location. (GIS)

RouteName – Name of the route of which this segment is a part, to support LRS. (GIS)

Latitude – Latitude in decimal degrees, WGS 1984, of the sign's location. (GIS)

Longitude – Longitude in decimal degrees, WGS 1984, of the sign's location. (GIS)

SignType – Type of sign.

SignWidth – Width in inches of the sign itself.

SignHeight – Height in inches of the sign itself.

SignPosition – Position of the sign relative to the track.

SignContents – Description of what the sign says.

Field Value Domains

BallastTypeCode

Field Type: Text, Width: 50

Code	Description
broken_stone	Broken Stone
sand	Sand
gravel	Gravel
moorum	Moorum
coal_ash	Coal Ash
cinder	Cinder
brickbat	Brickbat
other	Other

BoundaryTypeCode

Field Type: Text, Width: 25

Code	Description
switch_facing	
switch_normal	
switch_reverse	
subdivision_begin	
subdivision_end	
prefix_begin	
prefix_end	
suffix_begin	
suffix_end	
end_of_track	
milepost_equation_break	
interconnect	
track_name_change	
other	

CabSignalTypeCode

Field Type: Text, Width: 8

Code	Description
None	

4_aspect	
-----------------	--

CalibrationPointFlagCode

Field Type: Text, Width: 5

Code	Description
Yes	This point is also an LRS calibration point
No	This point is not an LRS calibration point

CalibrationPointTypeCode

Field Type: Text, Width: 25

Code	Description
milepost	This calibration point is a milepost
milepost_equation	This calibration point is the result of a milepost equation
subdivision	This calibration point is at a subdivision boundary
switch	This calibration point is at a track switch
other	This calibration point is something other than a milepost, equation, subdivision, or switch

CountryCode

Field Type: Text, Width: 2

Code	Description
[XX]	Two-letter (<i>alpha-2</i>) country codes as defined by ISO 3166-1 (<i>e.g.</i> , USA: US, Canada: CA, Mexico: MX)

CrossingTypeCode

Field Type: Text, Width: 16

Code	Description
public	
private	
pedestrian	

CrossoverFlagCode

Field Type: Text, Width: 1

Code	Description
Y	Is a crossover track
N	Is not a crossover track

DirectionCode

Field Type: Text, Width: 16

Code	Description
------	-------------

increasing	Speed applies in the direction of increasing milepost measures
decreasing	Speed applies in the direction of decreasing milepost measures
bidirectional	Speed applies in both directions

FBARDirectionCode

Field Type: Text, Width: 16

Code	Description
none	Form based authority is not required
bidirectional	Form based authority is required in both directions
increasing	Form based authority is required in the direction of increasing milepost measures
decreasing	Form based authority is required in the direction of decreasing milepost measures

FraDistrictCode

Field Type: Text, Width: 2

Code	Description
1	CT, MA, ME, NH, NJ, NY, RI, VT
2	DC, DE, MD, OH, PA, VA, WV
3	AL, FL, GA, KY, MS, NC, SC, TN
4	IL, IN, MI, MN, WI
5	AR, LA, NM, OK, TX
6	CO, IA, KS, MO, NE
7	AZ, CA, HI, NV, UT
8	AK, ID, MT, ND, OR, SD, WA, WY
99	Outside of the United States

GraphicTypeCode

Field Type: Text, Width: 20

Code	Description
signal_left	Signal positioned to the left of track, relative to increasing milepost measure
signal_right	Signal positioned to the right of track, relative to increasing milepost measure
signal_center	Signal positioned near the center of track or tracks
aspect_change_point	
none	

HornDisableCode

Field Type: Text, Width: 1

Code	Description
N	Horn may be sounded automatically

Y	Automatic horn is disabled
----------	----------------------------

MaxSpeedCode

Field Type: Single, Scale: 9

Code	Description
5	5 miles per hour
10	10 miles per hour
15	15 miles per hour
20	20 miles per hour
25	25 miles per hour
30	30 miles per hour
35	35 miles per hour
40	40 miles per hour
50	50 miles per hour
60	60 miles per hour
70	70 miles per hour
80	80 miles per hour

MilepostTypeCode

Field Type: Text, Width: 15

Code	Description
physical	The milepost is physically marked with a sign
virtual	The milepost is measured, but is not physically marked with a sign

MonitoredStatusCode

Field Type: Text, Width: 15

Code	Description
unmonitored	Device is unmonitored (signal, switch)
peer_to_peer	Device is monitored peer to peer
office	Device is monitored from office
both	Device is monitored both from office and peer-to-peer

NETTrackTypeCode

Field Type: Text, Width: 1

Code	Description
A	Abandoned rail line, rail still present
F	Rail ferry connection
I	Major industrial lead

M	Main line
O	Other track (minor industrial leads)
R	Abandoned rail line, rail physically removed
S	Passing sidings
T	Trail on former right-of-way
X	Out of service line
Y	Yard tracks

NodeTypeCode

Field Type: Text, Width: 25

Code	Description
routing	
prefix	
suffix	
subdivision	
milepost_equation_break	
interconnect	
track_name_change	
end_of_track	
disconnected	
other	

OperatorTypeCode

Field Type: Text, Width: 2

Code	Description
>	Speed restriction is greater than restriction parameter value
<	Speed restriction is less than restriction parameter value
=	Speed restriction is equal to the restriction parameter value
>=	Speed restriction is greater than or equal to restriction parameter value
<=	Speed restriction is less than or equal to restriction parameter value

PassengerTypeCode

Field Type: Text, Width: 1

Code	Description
A	Amtrak line
B	B
C	Commuter line
D	D

O	Other
R	Rail line, now rapid transit
T	Tourist line
V	VIA line
X	Previous passenger route/line
<null>	Not applicable, or unknown

QualifierTypeCode

Field Type: Text, Width: 15

Code	Description
head_end	
restricted_speed	
none	

RestrictionTypeCode

Field Type: Text, Width: 20

Code	Description
generic	
heavy_train_TPOB	TPOB: Tons per operative brake
heavy_train_tonnage	Overall tonnage
axle_count	

SCACCode

Field Type: Text, Width: 4

Code	Description
SEE APPENDIX C	

SignalAuthorityTypeCode

Field Type: Text, Width: 16

Code	Description
non_signaled	
bidirectional	
increasing	
decreasing	

SignalTypeCode

Field Type: Text, Width: 30

Code	Description
absolute_interlocking	

absolute_noninterlocking	
intermediate_stop_and_proceed	
intermediate_restricted	
distant_operative	
distant_inoperative	
track_circuit	
OS_track_circuit	

SpringSwitchTypeCode

Field Type: Text, Width: 20

Code	Description
not_spring_switch	
spring_normal	
spring_reverse	

StateAbbrCode

Field Type: Text, Width: 50, Precision: 0, Scale: 0

Code	Description
[XX]	Two-letter US Postal Service abbreviation for US states.

StracNetTypeCode

Field Type: Text, Width: 1

Code	Description
S	On the STRACNET system
C	Connector to the STRACNET system
<null>	Not on the STRACNET system

SwitchDirectionCode

Field Type: Text, Width: 4

Code	Description
LF	Left facing
LR	Left rear
RF	Right facing
RR	Right rear

SwitchProtectionCode

Field Type: Text, Width: 50

Code	Description
not_protected_by_signal_or_track_circuit	

protected_by_signal_stop_required	
protected_by_track_circuit_stop_required	
protected_by_signal_no_stop_required	
protected_by_track_circuit_no_stop_required	

SwitchOrientationCode

Field Type: Text, Width: 50

Code	Description
left_facing	Left facing switch
right_facing	Right facing switch
left_rear	Left rear switch
right_rear	Right rear switch

TieTypeCode

Field Type: Text, Width: 50, Precision: 0, Scale: 0

Code	Description
wood	Wood
concrete	Concrete
steel	Steel
plastic	Plastic
other	Other type

TimeZoneCode

Field Type: Single, Precision: 10, Scale: 0

Code	Description
-4	AST
-5	EST
-6	CST
-7	MST
-8	PST
<i>[other UTC offset]</i>	Any other time zone that does not intersect North America

TrackStatusCode

Field Type: Text, Width: 10

Code	Description
active	Broken Stone
inactive	Sand

TrackTypeCode

Field Type: Text, Width: 25, Precision: 0, Scale: 0

Code	Description
main	Main track
connection	Connection track
siding	Siding track
crossover	Crossover track
foreign	Foreign track
industry	Industrial track
yard	Yard track
industrial_lead	Industrial lead track
yard_lead	Yard lead track
other	Track that does not fit current categories

YardLimitsCode

Field Type: Text, Width: 1

Code	Description
Y	Yard limits are in effect
N	Yard limits are not in effect

APPENDIX A

Creating a Railroad Schematic Diagram Map

These steps may not be airtight for all kinds of datasets and situations. Feel free to contact Jim Barry at Esri (jbarry@esri.com) if you run into any snags, or have questions or comments.

1. Start with a File Geodatabase containing tracks (edges), and switches (junctions).
2. Inside the File Geodatabase, create a Feature Dataset, copy the tracks and switches feature classes into it.
3. Use "Create Trace Network" tool to create a trace network

Parameters:

Input Feature Dataset: your feature dataset that contains the tracks and switches feature classes

Track Network Name: [give this new trace network a name]

Input Junctions: your switches feature class

Input Edges: your tracks feature class

Connectivity Policy: "Simple edge"

Then click "Run"

4. In catalog, go to your Feature Dataset and you should see your new trace network. Click and drag it onto the map. You will get a popup message asking, "Do you also want to add all classes that participate in 'your trace network' to the map?" Click "Yes".

5. Go to your contents pane and expand the trace network group layer. You will notice that the entire map area is purple, because when the trace network is first created, it is all a "dirty" area.

6. Use the "Enable Network Topology" tool to enable network topology.

Parameters:

Input Trace Network: [choose your new trace network]

Advanced Options: [take the defaults]

Then click "Run"

7. If you have any topology errors, they will appear in the map. There could be Point errors, Line errors, Junction errors, or Dirty areas. Use the editing tools on the Edit ribbon to fix those. Here are some examples of errors you may have:

- a. You may have missing or duplicate junctions. Edit the switches layer so that everywhere 3 or more track polylines touch at their end nodes that there is one switch feature snapped to it.
- b. You may have polylines that are not split at junctions. Use the "Line Intersection" editing tool to split the polyline at the point where it should be split by the intersecting line.
- c. You may have "pseudonodes". That is, two polylines that are connected at the end points. These two polylines should be merged into one. Use the "Merge" editing tool for this.

d. There may be other issues. Simply examine the contents of all 4 of the topology errors layers in the Trace Network group layer, and use the edit tools for fix all of those.

8. Be sure to save all of your edits before continuing further.

9. Run the "Disable Network Topology" tool, using your trace network as the parameter.

10. Run the "Enable Network Topology" tool, using your trace network as the parameter. When this tool completes running, you should have no more error features in any of the Trace Network group layer's error layers. If you still have errors, go back (to Step 7) and edit those, and don't continue (to Step 11) until your run "Enable Network Topology" and there are no more errors.

11. Run the "Validate Network Topology" tool, using your trace network as the parameter, and using the "Default" extent. If it runs successfully, you should get a message saying that the "Validate Network Topology completed with warnings", and if you View Details, you should see "WARNING 001804: A dirty area is not present within the specified extent". This is ok.

12. In the map, use the "Select - Rectangle" tool to drag a box to select all of the features you want to build a schematic map for.

13. Go to the "Trace Network" ribbon and its "Data" tab. In the "Diagram" button group, click "New" then "Basic". This will create a new diagram. It will not look like a schematic yet. In fact, it would look very similar to the original rail data. This is just a test to ensure that you can completely create trace network topology without errors.

14. Close the Diagram. We do not need it anymore.

15. Open the attribute table for the switches layer and add a new column called "NetAttribs". Give it a data type of Integer, and allow nullable values.

16. Add values to this column in order to establish a track hierarchy. Where you just have one track or two tracks side by side, you can give the tracks a value of 1. Where there are crossovers between two tracks side by side, you can give those crossovers a value of 2. The first spur or loop extending outward from the main tracks, give a value of 3. New spurs beyond 3, you can give odd values successively, like 5, then 7, then 9 and so on. Crossovers between spurs you can give even numbers between them. For example a spur with a value of 9 and the next spur with a value of 11, if there is a crossover between them give a value of 10. Take a look at the diagram below for guidance on how to add values to the NetAttribs field. When you are done adding NetAttribs values, save all of your edits.

17. Run the "Disable Network Topology" tool, using your trace network as the parameter.

18 Run the "Add Network Attribute" tool.

Parameters:

Input Trace Network: [your trace network]

Attribute name: give it a name. I usually use "Track Hierarchy"

Attribute Type: choose "Long (large integer)"

Nullable: check this ON

Then click "Run"

19. Run the "Set Network Attribute" tool.

Parameters:

Input Trace Network: [your trace network]

Network Attribute: choose "Track Hierarchy"

Feature Class: select your tracks layer

Field: choose the "NetAttribs" field

Then click "Run"

20. Run the "Enable Network Topology" tool, using your trace network as the parameter.

21. Run the "Validate Network Topology" tool, using your trace network as the parameter. The only warning you should get, again, is "001804" about how there are no dirty areas. That's ok.

22. In the map, use the "Select - Rectangle" tool to drag a box to select all of the features you want to build a schematic map for.

23. Go to the "Trace Network" ribbon and its "Data" tab. In the "Diagram" button group, click "New" then "Basic". This will create a new diagram. It will not look like a schematic yet. In fact, it would look very similar to the original rail data.

24. With the new Diagram open, run the "Apply Relative Mainline Layout" tool.

Parameters:

Input Network Diagram Layer: select "Temporary Diagram"

Line Attribute: select "Track Hierarchy"

Direction: select "From left to right"

Offset between branches: enter "20 Meters"

Break Point Angle (in degrees): enter 45

Under "Line Classification":

Type Attribute: "Track Hierarchy"

Accept all other default parameters

Your result should look something like this:

APPENDIX B

Creating a Location Referencing System for Railroad Data

Background

The steps below start with a line dataset of rail centerlines and a point dataset of track switches which are where three or more track lines will need to snap to. The point dataset of track switches also needs to contain points that represent bumper stops in situations where the end of a track centerline just stops (*spurs, turnouts, terminals, dead ends*). The rail centerlines become the edges in this network, and the track switches and bumper stops serve as the junctions in the network.

Prepping the data

While ArcGIS Roads and Highways only works when all of the data is stored in enterprise geodatabases, and served as web services from ArcGIS Enterprise, there is a lot of prep work you can do on that data using locally stored file geodatabases. The steps below do as much prep work as possible in file geodatabases, then later in the steps, the FGDBs are imported into EGDBs, for the remaining steps.

Steps

1-- Start with a FGDB containing a FDS. (*quick definitions - FGDB: File Geodatabase, FDS: Feature Dataset, FC: Feature Class*)

*2-- In that FDS there should be a PolylineMZ feature class of track segments to serve as network edges.

*3-- In that FDS there should be a PointMZ feature class of track nodes to serve as network junctions.

**(Note about Steps 2 and 3: To check to see if a feature class supports M and Z, in Catalog, right click on the feature class, click Properties, then in the Properties popup, on the Source tab, check for "Yes" in the rows labeled "Coordinates have Z value" and "Coordinates have M value". If your feature classes do not support M and Z, you can use the Export Features tool and its Environments tab to ensure that the exported output supports M and Z.)*

4-- Every polyline in the track segments FC should start and end with a point in the track nodes FC. Check to ensure this is true.

5-- And of course since both FCs are in the same FDS, they must share the same spatial reference. If you get any errors that mention mismatched spatial reference as you put these two FCs into the same FDS, you'll need to use the *Project* tool on one or both of them to get them into the same spatial reference as the FDS.

6—Next. It's important to ensure that all of the FCs in the FDS have valid network topology. Building a Trace Network, then Enabling, then Validating topology is a great way to do this, and where topology errors are found, fix them all until you can Validate a clean network topology for all FCs that will be participating in the LRS. For railroads, at a minimum this will be the track segments FC and the track nodes FC.

7-- Another tip, is to use an "arrow along" line symbol on the tracks layer in order to visually inspect the digitized direction of the track lines. You'll have smoother results if you can make it so that all track lines flow in the same digitized direction. When it comes to mileposts/kilometerposts, check with the railroad to understand which direction that post measurements are ascending, then fix the data so that digitized directional flow conforms. This is not required

of course. It's just best practice for building a tight foundational database. And don't just check the main tracks, but also the crossovers, spurs, loops, and yards. This is not always perfectly possible given some types of track organization like U-curves, lollipops, turntables, and other structures that might pose a challenge, but do your best. The polylines that are misoriented, you can select, then use the *Flip Line* tool to flip their digitized direction to get the track data to flow in the same direction.

8-- What we're going to do below is prepare the data for use with ArcGIS Roads & Highways. To do this will follow several steps, using tools you'll find in the toolboxes: *Linear Referencing* and *Location Referencing*. Here is a list of tools, in order, that you will be using, in case you want to move them into your Favorites list:

Create Routes
Add Field
Calculate Field
Create LRS
Create LRS Network
Append Routes
Generate Calibration Points
Generate Routes
Create LRS Event

9-- Create a new column in the track segments polyline feature class to store the route names. For the purposes of the rest of these instructions, we're going to assume that you give this field the name "*RouteName*". Populate that field with route name values, in a way that all polylines that you want to be in the same route, should get the same route name value. For example, each of the main lines along the way should be its own route from start to finish, but then each crossover, spur, and loop should be their own routes. It helps to use a consistent naming structure.

10-- In the *Linear Referencing* toolbox, run the *Create Routes* tool.

- Input line features: use the polyline FC from Step 2
- Route Identifier Field: should be "*RouteName*" (or the name from Step 9)
- Output Route Feature Class: if the polyline FC is called "*abc*" then call the output "*abc_routes*". (**IMPORTANT!!**: The tool will—by default—try to write this output routes FC into the default project FGDB. Instead, navigate to the same FDS the tracks and switches FCs are stored in, to ensure that the new routes FC output will go into that same FDS.)
- Measure Source: "*Length of Features*" (don't worry, we can recalibrate later)
- Coordinate Priority: [Whatever makes sense for your data. What helps is if you use arrow symbology to inspect the digitized direction of your lines in order to choose the best orientation setting in this pull-down.]
- Measure Factor, 1; Measure Offset, 0;
- Ignore spatial gaps, check on; Build index, check on;
- Click *Run*

11—Add some new columns to this new output routes FC and calculate values into them. One way to do this is to open the attribute table, then using its Add and Save buttons, then for each new field, right clicking the field header to get to the field calculator. Another way to do this is with the *Add Field* and *Calculate Field* tools. Either way:

- add two new Date columns called: *FromDate*, *ToDate*.
- add a new Text(38) column called: *RouteId*
- on the Fields ribbon, click *Save*, to save these new columns.
- close the Fields panel, returning to the attribute table panel.
- In the attribute table, right click the *FromDate* field name, and in the popup menu click "Calculate Field".
- In the *Calculate Field* dialog box, change *Expression Type* to "Arcade".

- In the text box under “FromDate =”, scroll down the “Helpers” box and double-click to select “Now ()”, then click OK. (Using Arcade ensures that the date/time will use GMT/Zulu/UTM+0 time. There is a way to do this with Python, but that will pull the local time off your machine, and will may cause problems after this FC is published as web services.)
- Leave the values in the ToDate column as null
- Now calculate the RouteID field with a Guid using Arcade: `RouteId = Guid()`.
- or...
- If you’d rather use Uuid’s instead of Guid’s, you can use Python instead of Arcade. If so, then write this line into the “RouteId =” textbox:

```
{' + str(uuid.uuid4()) + '}
```

And write this line into the “Code Block” box, then click OK:

```
import uuid
```

12-- Create a new empty LRS: *Location Referencing tools > Configuration > LRS > Create LRS*

- Input Location: use the FDS from Step 2
- LRS Name: if your FDS is “abc_fds”, call this new lrs “abc_lrs”
- Centerline Feature Class Name: default *Centerline*
- Calibration Point Feature Class Name: default *Calibration_Point*
- Redline Feature Class Name: default *Redline*
- Centerline Sequence Table Name: default *Centerline_Sequence*
- Spatial Reference: [same as the ~routes FC in the FDS]
- Tolerances and Resolutions: just take the defaults (If your source data is unprojected, you may get red X’s next to the boxes “Z Tolerance” and “Z Resolution”. If so, just change the units for those to “Decimal Degrees”, and that should remove the red X’s and allow you to continue. Do not change any of the numeric values, because those must match the same parameters that belong to the FDS that these layers belong to.)
- Click Run

13-- Back in the map, create a Group Layer called “base layers” and put your original polyline, point, and route FCs into it, to sort of get them out of the way.

14-- Create a new LRS Network: *Location Referencing tools > Configuration > LRS Network > Create LRS Network*

- Input Location: use the FDS that contains the routes FC you created in Step 10.
- LRS Name: Should auto-populate with the name of the LRS you had just created, which is stored in that FDS. If it doesn't appear, then you may not have been storing everything into the same FDS, as you need to be. Important to remember that these tools often try by default to send output to the project's default FGDB. You should always navigate the output away from that, and instead send the output to the FGDB you created above where everything else is being stored
- LRS Network Name: if your FDS is “abc_fds” and your LRS is “abc_lrs”, make it “abc_lrs_network”
- Route ID Field: `RouteId`
- Route Name Field: `RouteName`
- From Date Field: `FromDate`
- To Date Field: `ToDate`
- Derive from line network, *unchecked*; Include fields to support lines, *unchecked*; Measure Unit, *Miles (US Survey)*;
- Click Run

15-- Append the routes into the LRS Network: *Location Referencing tools > Append Routes*

- Source Routes: use the routes FC you created in Step 10

- LRS Network: use the LRS Network you created in Step 14
- Route ID Field: default, should be *"RouteId"*
- Route Name Field: default, should be *"RouteName"* (or the name from Step 9)
- From Date Field: default, should be *"FromDate"*
- To Date Field: default, should be *"ToDate"*
- Field Map section: just leave them all blank by default
- Load Type: default, should be *"Add"*
- Load Field: default, should be *"Route ID"* (older versions of Pro do not have this option, that's ok)
- Consider existing centerlines, leave *unchecked*.
- Click *Run*

16-- Generate the calibration points: *Location Referencing Tools > Generate Calibration Points*

- Input Polyline Features: use the routes FC you created in Step 10
- Route ID Field: use the `RouteId` field from Step 11
- FromDate, ToDate: use the `FromDate` and `ToDate` fields from Step 11
- Calibration Point Feature Class: use the *Calibration_Point* layer created in Step 14
- LRS Network: use the LRS network you created in Step 14
- Calibration Direction: use *Digitized direction* (see Step 7 for more info)
- Calibration Method: use *Geometry length*
- .Click *Run*
- *Note: After the tool runs, it may return a "Warning 130108", despite completing successfully, with a note about M-resolutions being different between the routes FC and the LRS network. I've found most of the time that the difference is at a decimal precision far smaller and insignificant than the accuracy of any dataset you'll be using. Ultimately, that's up to you, but for most purposes, we can just keep going.*

17—Generate routes: *Location Referencing Tools > Generate Routes*

- Input Route Features: use the LRS Network you created in Step 14
- Record calibration changes...: leave *unchecked* (newer versions of Pro do not have this option, that's ok)
- Click *Run*

18—Create a LINE event layer to store linear events that record and display max speed limits along the rail line: *Location Referencing Tools > Configuration > Create LRS Event*

- Parent LRS Network: use the LRS network you created in Step 14
- Event Name: name it *"MaxPermissibleSpeed"* (more info: see the ArcGIS Railroads Data Model data dictionary)
- Geometry Type: *Line*
- Event ID Field: *EventId*
- Route ID Field: *FromRouteId*
- From Date Field: *FromDate*
- To Date Field: *ToDate*
- Location Error Field: *LocError*
- MeasureField: *FromMeasure*
- To Measure Field: *ToMeasure*
- Store Route Name: check on
- Route Name Field: *RouteName*
- Click *Run*
- *If you want, now or later, you can add other fields as described in the ArcGIS Railroads Data Model.*

19-- Create a POINT event layer to store point events that record and display crossings (*grade, overpass, underpass*) along the rail line: *Location Referencing Tools > Configuration > Create LRS Event*

- Parent LRS Network: use the LRS network you created in Step 14
- Event Name: name it *"TrackSignage"* (*more info: see the ArcGIS Railroads Data Model data dictionary*)
- Geometry Type: *Point*
- Event ID Field: *Eventid*
- Route ID Field: *FromRouteId*
- From Date Field: *FromDate*
- To Date Field: *ToDate*
- Location Error Field: *LocError*
- MeasureField: *Measure*
- Store Route Name: check on
- Route Name Field: *RouteName*
- *If you want, you can add other fields as described in the ArcGIS Railroads Data Model.*

20-- Ensure the FDS components have global IDs and have editor tracking enabled

- In Catalog, navigate to the FDS you've been working with since Step 1
- Right-click the FDS, then click *"Manage"*
- In the *Properties* popup dialog, in the *Manage* tab, ensure the *Global IDs* and *Editor tracking* are both *checked on*. One or both of the boxes might already be *"boxed on"*. Click it twice to ensure that it is actually *"checked on"*.
- When you check on *Editor tracking*, it will drop down a few field names and pull downs, just accept all the defaults.
- Click OK. And watch the process run until two green check boxes appear. When successful, the dialog will vanish.

21—Ensure the Centerline_Sequence table has global IDs and editing tracking enabled

- In Catalog, navigate to the FGDB you've been working with since Step 1
- Right click the *Centerline_Sequence* table, then click *"Manage"*
- In the *Properties* popup dialog, in the *Manage* tab, ensure that *Global IDs* and *Editor tracking* are checked on. You can check *Attachments* on or off, your choice.
- When you check on *Editing tracking*, it will drop down a few field names and pull downs, just accept all the defaults.
- Click OK. And watch the process run until two green check boxes appear. When successful, the dialog will vanish.

AND FINALLY:

- SAVE THE PROJECT and CLOSE OUT PRO. This will force all locks to be removed from the FGDB you created.
- Use Windows Explorer to navigate to the folder in which your FGDB is stored. Zip up the FGDB folder and get ready to move it somehow to your server for the next steps.

%%

Move the data to ArcGIS Enterprise

Now you have gotten as far as you can go with FGDBs. The next set of steps involve moving all of your prepared data into Enterprise Geodatabases so that you can begin working with your data using ArcGIS Roads & Highways Server, which is an extension of ArcGIS Enterprise.

FIRST:

In Pro, ensure that you are logged into an enterprise portal that has Roads & Highways installed and running. If you created the FGDB on your local machine, then you need to find a way to zip it up and move it to the server.

22. Create a new empty Enterprise GDB for each of the FGDBs that you want to port over. To do this, run the *Create Enterprise GDB* tool, using these parameters:

- database platform - SQL Server *(for example, but whatever yours is)*
- instance – mydb *(for example, or whatever your database instance is)*
- database - *[your choice, for what you want the db to be called]*
- database administrator – gdb *(for example, or whatever your dba name is)*
- database administrator password - *[your database administrator password]*
- sde owned schema - uncheck it
- authorization file - *[Server_Ent_Adv.ecp file for the edition and version you're running]*
- spatial type – ST_Geometry
- Click *Run*

23. Create a connection, as the SDE user, to this new EGDB that you created. *(Later we will create a connection for the GIS user, and this connection we're creating for the SDE user will allow us to create new users, like in our case, the GIS user.)* So, first, to create this new SDE user connection, run the *Create Database Connection* tool, with these parameters:

- Connection File Location – Navigate to a folder on disk. It can pretty much go anywhere, but might be good to make a “*connectionfiles*” folder somewhere you won't misplace.
- Connection File Name – Anything is ok, but a good convention is to name it the name of the database, then “as”, then the name of the connection, in our case “SDE”. Like “*lametro as SDE*”
- Database Platform – whatever yours is, say PostgreSQL or SQL Server, etc.
- Instance/Server – whatever your databases server instance is
- Database Authentication – check ‘on’ if you're using db authentication
- Username – your db username
- Password – your db password
- Save username and password – checked on/off as you see fit
- Database – your database name created in step 22, should be in a drop-down
- Geodatabase Connection Properties:
 - Version Type – Branch
 - The following version will be used = sde.DEFAULT
- Click *Run*

24. Go to Windows Explorer, to the folder in which you stored the connection file created in 23, to see if it's there and looks good. The file should be called “*dbname as SDE.sde*”. For example: “*lametrog as SDE.sde*”

25. Create a new folder connection to the database connection you just created in step 23. To do this:

- Go to Catalog
- Right click “*Folders*”

- Click “Add Folder Connection”
- In the open file dialog, navigate to the folder where you’re storing your connection files
- Click OK
- Back in Catalog, tick open the new folder connection. In that folder connection you should see your database connection you created in step 23.

26. Now that the connection has been created and made accessible in your project, now you can use that “SDE” connection to create a new user. In our case, we’ll call this the “GIS” user. To do this, run the *Create Database User* tool with these parameters:

- Input Database Connection – In the open file dialog, navigate to and select the “SDE” database connection created in step 23
- Database User – Whatever you want to call this user, but when in doubt, you can use “gis”.
- Database User Password – Whatever you want the password for this user to be
- Role – leave blank
- Click *Run*

27. Now we want to create a database connection for this new database user created in step 26. To do this, run the *Create Database Connection* tool with these parameters:

- Connection File Location – folder where you’re storing your connection files
- Connection File Name – what you want to call this file. A good convention is to use “[dbname] as [USER].sde”. For example: “*lametrog as GIS*”
- Database Platform: PostgreSQL, SQL Server, or whatever your RDBMS type is
- Instance/Server – your database server instance
- Database Authentication – checked ‘on’
- Username – whatever you want the username to be; a good convention is “gis”
- Password – whatever you want the database user’s password to be
- Save username and password – checked ‘on’
- Database – name of the database you created in step 22
- Geodatabase Connection Properties
 - Version Type – Branch
 - The following version will be used – sde.DEFAULT
- Click *Run*

28. Go to Catalog, to Folders, then to your connectionfiles folder to see now that there are two database connections listed. One for the *SDE* user, and one for the other user, which you may have called the *GIS* user. It’s inside this *GIS* user database connection is where we will be copying the file geodatabase and all of its feature classes and tables that were created from steps 1-21. The *GIS* user will be hosting all that data inside the enterprise geodatabase.

29. Now we’re going to copy all of the data from the FGDB into the EGDB. Here are the steps:

- Inside your FGDB, but not inside the FDS, find the set of 3 flat tables (*Centerline_Sequence*, *Lrs_Edit_Log*, *Lrs_Locks*)
- Copy those three tables into the root of your new EGDB
- Next, if you have a table called “*Centerline_Sequence_ATTACH*” and a relationship called “*Centerline_Sequence_ATTACHREL*”, copy those over too.
- Next, if you have any feature classes that are not in the FDS, copy those over as well
- Finally, copy the entire FDS at once, and paste it into your new EGDB.

- (Note: It's important to copy these components over separately and in the order listed above.)
- Open the EGDB connection and refresh it to see that everything made it over.

30. Now we're going to get the EGDB datasets ready for branch versioning. Here are the steps:

- In Catalog, go into your EGDB, and right-click on the "Lrs_Edit_Log" table, in the popup menu click "Manage", and in the Table Properties dialog, check 'on' Versioning, and radio 'on' Branch, then Click "OK".
- Do the same for the "Lrs_Locks", and any "Centerline_Sequence*" tables.
- Then go into the FDS, click one of the FCs, say perhaps the "Centerline" FC, then click "Data Design > Fields" to ensure that there is a GlobalID field in there.
- Then in Catalog, go into the EGDB, select the FDS, then right click the FDS and in the popup menu, click "Manage".
- In the Feature Dataset Properties dialog, in its Manage tab, check 'on' "Versioning", then radio 'on' "Branch".
- You can leave "Replica Tracking" checked 'off'.
- You will notice that there are checked 'on' options for Archiving, Global IDs, and Editor Tracking. If not, then you can fix those later.
- Then click "OK"

31. In the Pro project, you currently have a Map that contains the entire FGDB that you created from steps 1-21. So now we will create a new empty Map, in which we will load up the entire EGDB. Here are the steps:

- On the Insert ribbon, click "New Map"
- Name this map "LRS Geographic in EGDB" or "LRS Schematic in EGDB"
- If you want, probably a good idea to set the spatial reference of the Map to *WGS 1984 Web Mercator (auxiliary sphere)* to make it smoother when publishing web layers later, even if that spatial reference differs from the spatial reference of your FDS.
- In Catalog, drag the FDS into the map. Leave the tables behind. Just the FDS.
- If you're working with a schematic map, feel free to turn off (or remove) the basemap layers from the Map, leaving a blank white canvas.
- In the Contents pane, if the layers' names are displaying with their fully qualified database names, then change the names of all of the layers, removing the full qualified database name portion of the layer name. For example, if a layer is called "lametrog.gis.Centerline", just change the name of the layer to "Centerline". This is to prevent users outside your organization from knowing the name of your database and the name of the database user.
- If this is the only Map currently in the project, great. But if the project already contains any Maps, say perhaps a Map that contains your FGDB FCs, then remove and delete that Map from the project. Make this project so that it only contains one Map, and that Map only contains your new EGDB-based LRS.
- In Catalog, tick open the "Maps" section to ensure that this project only contains this one new empty map that you just created. If there are others, then one at a time, right-click each, then click Delete to remove those maps from the project altogether.
- Save the Project. Or if you want to Save As, so that you don't lose the other Map, that's fine too.

32. Now we're going to publish the map service. Here are the steps:

- On the Share ribbon, under Web Layer, click "Publish Web Layer"
- Now we're going to check to see if branch versioning is setup correctly. In the "Sharing As Web Layer" tool pane:

- Go to the Configuration tab
 - Under Capabilities, ensure that Version Management is there. That tells you that all of the layers in the map have been setup for branch versioning. This is an important gut check, because if it's not there, then any subsequent configuration won't work and will be for naught. If Version Management is not there, then you need to fix that in the map and datasets before proceeding. Do not check the box 'on'; leave it checked 'off' for now.
- Go back to the General tab
 - Give this Web Layer a name. In my case "LAMetros".
 - Summary and Tags are optional
 - Reference registered data – Map Image radio 'on', and Feature check 'on'
 - This makes it so that the data is left in the EGDB and is NOT copied over into the enterprise relational data store
 - Copy all data – all options radio 'off'
 - Portal folder – Whatever folder you want this to be in. In my case I have an LAMetro_g or LAMetro_s folder
 - Server and Folder – The Server and Folder you want to publish the map service.
 - Then for the folder, choose one, or type in a new one. Might be good to give the folder the same name on the utilities-transportation portal as you're using on the utilities-ent portal
- Then go to the Configuration tab – LEFT most icon, the yellow pagey icon
 - Layers section – should contain Map Image and Feature
 - Additional Layers – no need for WMS or WFS or OGC
 - Capabilities – check 'on', both Linear Referencing and Version Management
- Then in the Configuration tab – MIDDLE icon, looks like white page with popup on it icon
 - Leave it as None (Assumed UTC).
- Then in the Configuration tab – RIGHT most icon, looks like three white pages icon
 - Instance Type – radio 'on' "Dedicated instance"
 - Number of instances per machine – Min 2, Max 4 is ok to start
- Then in the Content tab
 - Under "My Content", should show the portal folder that your stuff is in
 - Under that should be Map service with layers underneath
 - Under that should be Feature service with layers underneath
- Click "Analyze" and fix errors, and pay attention to warnings
- If you get error 00231 about layers data source must be registered with server, then:
 - tick it open,
 - right click on the first layer,
 - then click "Register Data Source With Server"
 - This brings up a dialog called "Add data store"
 - Title – lametrog_datastore
 - Tags – optional
 - Portal folder – LAMetro_g like the other one
 - Same as publisher database connection – radio 'on'
 - New connection – radio 'off'
 - Select the servers... - check 'on' ONLY the utilities-transportation server
 - Click "Validate", which should put a green check next to the utilities-transportation server
 - Click "Create"
 - Then back in your Messages window, tick closed the 00231 error list
- If you get error 00374 about Unique numeric IDs are not assigned
 - Right click on that error
 - Click "Open Map Properties to Allow Assignment"
 - Then in Map Properties dialog, check 'on' "Allow assignment of unique numeric IDs..."

- Click “OK”
- If you get a warning 24034 about default z values not being assigned, then:
 - In the Share As Web Layer tool pane, go to the Configuration tab
 - Click the left-most icon, the yellow curvy rectangle
 - In the “Layer(s)” section, click the pencil to the right of “Feature”
 - Check ‘on’ the property “Apply default to features with z-values”
 - Check ‘on’ the property “Allow geometry updates without m-value”
- Still in the “Share As Web Layer” pane, click back over to the Messages tab
- Click the “Analyze” button again
 - If all red X errors are gone, then you’re good
 - If all warnings are gone except for minor ones, then you’re good
 - Warning 10001: Data source projection difference: IS OK
 - Warning 24078: Layer’s data source not supported: IS OK, as long as it’s only referring to the basemaps
- Once “Analyze” does ok, per above, then click “Publish”. Clicking “Publish” actually runs an Analyze again, that’s ok.
- At the bottom, you should end up with a green bar that says the web layer has successfully published. In that bar is a hyperlink labeled “Manage the web layer”, click that.

33. That opens a browser which brings you to the utilities-ent portal. If it’s not signed in yet, sign in as railadmin/railadmin1234. Either way, go to the Content tab. Go to the folder where you put the stuff in and you should see:

- The Feature layer
- The Map Image Layer
- The Data Store (Database)

34. Click on the Feature Layer item.

- See that all the layers are there.
- You can setup layer symbology here if you want, saved with layer.
- You can bring feature service into web map, and setup symbology there if you want.
- Check popups. See if everything looks cool.
- SAVE THE PROJECT.
- You can now close the Pro project and exit Pro. We’re done with it.

35. From any machine, even your local machine outside the RDP, let’s go to the server manager:

- On the folders pane on the left, click on the LAMetro_g server folder you created
- On the main pane, should say “Lametrog (Map Service)”
 - Service runtime: ArcGIS Pro
 - Instance type: Dedicated
 - Status: Started
 - Instances Running: 4
 - Instances in Use: 0 (so far)
 - Maximum instances: 4
- Then on the right, the run button should be disabled, and the stop button enabled, which tells you that it’s running.
- On the Main pane there, click on the map service name
 - Path: tells you which Pro project was used to create this map service
 - Capabilities tab: these options should be turned on: Mapping, Feature Access, Version Management, Linear Referencing

- Clicking on the Mapping gives you the end points for the map service, and clicking on the Feature Access gives you the endpoints for the feature service. Along with operations allowed.
- Back in Server Manager, click back on Lametro_g to go back to the top folder
 - Click on the database icon that's to the right of (Map Service)
 - Then in the Service Workspaces dialog, click on sde.DEFAULT, and below in Workspace Properties, it'll tell you everything about how this was setup, database it's pointing to, etc.
 - Click *Close*

36. Now let's create an *Event Editor* web app

- The steps below are all covered thru this page here
<https://enterprise.arcgis.com/en/roads-highways/latest/event-editor/configuring-the-event-editor-web-application.htm>
- Use File Explorer and go to your web server root. If you're using MS-IIS, then it's usually *inetpub\wwwroot*
- Create a folder that will be your website
- Go to C:\Program Files\ArcGIS\LocationReferencing\Server11.x\Web\RoadsandHighways\RoadwayCharacteristicsEditor
- Select all contents and copy
- Go back in your *inetpub\wwwroot\[your_website]* folder, paste it all in

37. Create a Web Map

- In a browser, log into your portal
- In the *Contents* tab, in the folder you put the published web layers into, find the Map Service (*not the feature service*) and open its portal Item page.
- Click the blue "*Open in Map Viewer*" button. The New Map Viewer is ok now.
- Change the basemap to whatever you want. If schematic, then blank white is ok.
- Save your webmap by giving it a title, tags, summary, then Save.

38. Start configuring the event editor web app

- Grab web map item ID
- Go into the event editor app folder and open up config.json in a text editor, then add:
 - Line 2: the web map ID
 - Line 10: the portalUrl ([https:// \[your enterprise server domain\] /portal](https://[your enterprise server domain]/portal))
 - *[Leave notepad open. We have more steps to do in a bit.]*

39. Register the event editor app in your portal, to get an AppId

- Go to the Content tab of the utilities-transporation portal
- Click "Add Item", then "An Application"
 - Type: Web Mapping
 - Purpose: Ready To Use
 - API: JavaScript
 - URL: *[the path to the folder under your web server's root]*
 - Title: *[Give it a name]* Event Editor
 - Tags: give it tags
 - Click "Next"

- It leaves you at the app's item page.
- Click "Settings"
- Scroll down and then click "Register"
 - App Type: Browser
 - Redirect URI: *[The url to your web server]*
 - Click "Add"
 - Click "Register"
- Then under "App Registration" copy the App ID to the clipboard
- Then back in *config.json*:
 - Line 8: paste in the App ID.
 - Line 25: give the event editor a name "*[your event editor name]* Geographic Event Editor"
- then Save and Close the *config.json* file and Notepad.

40. Open both Event Editors

- YOU MUST USE DIFFERENT BROWSERS OR PROFILES, NOT JUST DIFFERENT TABS
- Now you can use the Event Editor tools to start adding and retiring events.

APPENDIX C

Standard Carrier Alpha Codes (SCAC)

These are “railroad reporting marks” assigned to railroad organizations by RailInc™. In this data model, these are the values that you will find in the “SCACCode” domain.

SCAC	CARRIER NAME
AA	ANN ARBOR RAILROAD
AARE	RAILINC CORPORATION - TEST
AARW	RAILINC PROGRAM COMMUNICATIN TO TRAIN
AB	AKRON BARBERTON CLUSTER RAILWAY COMPANY
ABL	ALAMEDA BELT LINE
ABR	ATHENS LINE LLC, THE
ABS	ALABAMA SOUTHERN RAILROAD
ABWR	ALABAMA WARRIOR RAILWAY, LLC.
AC	ALGOMA CENTRAL RAILROAD INC
ACJR	ASHTABULA CARSON & JEFFERSON RAILROAD
ACR	AGAWA CANYON RAILROAD ULC
ACWR	ABERDEEN CAROLINA & WESTERN RAILWAY CO
ADBF	ADRIAN & BLISSFIELD RAIL ROAD COMPANY
AERC	ALBANY & EASTERN RAILROAD COMPANY
AF	ALABAMA & FLORIDA RAILWAY CO
AFR	AMADOR FOOTHILLS RAILROAD
AGCR	ALAMO GULF COAST RAILROAD COMPANY
AGR	ALABAMA & GULF COAST RAILWAY LLC
AIKR	AIKEN RAILWAY COMPANY, LLC
AKDN	ACADIANA RAILWAY COMPANY
AKMD	ARKANSAS MIDLAND RAILROAD CO INC
ALE	ALABAMA EXPORT RAILROAD INC
ALLN	ALLENTOWN AND AUBURN RAILROAD
ALM	ARKANSAS LOUISIANA & MISSISSIPPI RAILROAD COMPANY
ALR	ALABAMA RAILROAD, LLC
ALS	ALTON & SOUTHERN RAILWAY COMPANY
ALT	AIRLAKE TERMINAL RAILWAY COMPANY
AM	ARKANSAS AND MISSOURI RAILROAD CO
AMTK	AMTRAK-NATIONAL RAILROAD PASSENGER CORPORATION
AN	AN RAILWAY LLC
ANR	ANGELINA & NECHES RIVER RAILROAD COMPANY
ANRG	ALTEX ENERGY LTD
ANY	ATHABASCA NORTHERN RAILWAY LTD
AO	APPALACHIAN & OHIO RAILROAD INC
AOK	ARKANSAS-OKLAHOMA RAILROAD INC
AOR	THE ALIQUIPPA & OHIO RIVER RAILROAD COMPANY
APA	APACHE RAILWAY COMPANY
APD	ALBANY PORT DISTRICT
APNC	APPANOOSE COUNTY COMMUNITY RAILROAD INC
APR	ALBERTA PRAIRIE RAILWAY
AR	ABERDEEN AND ROCKFISH RAILROAD COMPANY
ARA	ARCADE AND ATTICA RAILROAD CORPORATION
ARC	ALEXANDER RAILROAD COMPANY
ARR	ALASKA RAILROAD CORPORATION
ARS	ARKANSAS SOUTHERN RAILROAD
ART	A & R TERMINAL RAILROAD
ARZC	ARIZONA & CALIFORNIA RAILROAD CO
ASRY	ASHLAND RAILWAY CO
AT	AFFTON TERMINAL SERVICES RAILROAD, LLC
ATCR	ATCS TESTING & FIELD EVALUATION
ATCS	ATCS TESTING & FIELD EVALUATION

ATL	ATLANTIC RAILWAYS COMPANY LLC
ATLT	AT & L RAILROAD CO INC
ATN	ALABAMA & TENNESSEE RIVER RAILWAY LLC
ATR	ALLIANCE TERMINAL RAILROAD LLC
ATW	ATLANTIC & WESTERN RAILWAY, L P
AUT	AUTAUGA NORTHERN RAILROAD LLC
AVR	ALLEGHENY VALLEY RAILROAD COMPANY
AVRR	AG VALLEY RAILROAD, LLC
AWRR	AUSTIN WESTERN RAILROAD
AWRY	ADAMS WARNOCK RAILWAY, INC.
AWW	ALGERS WINSLOW AND WESTERN RAILWAY COMPANY
AZCR	ARIZONA CENTRAL RAILROAD INC
AZER	ARIZONA EASTERN RAILWAY COMPANY
BAWT	BAYWAY TERMINAL SWITCHING COMPANY LLC
BAYL	BAY LINE RAILROAD L L C, THE
BB	BUCKINGHAM BRANCH RAILROAD COMPANY
BBAY	BOGALUSA BAYOU RAILROAD LLC
BCLR	BAY COLONY RAILROAD CORPORATION
BCR	BAY COAST RAILROAD
BCRM	BCR PROPERTIES LTD.
BCRY	BARRIE-COLLINGWOOD RAILWAY
BDRV	BELVIDERE & DELAWARE RIVER RAILWAY COMPANY INC
BDTL	BALLARD TERMINAL RAILROAD CO LLC
BDW	BIGHORN DIVIDE & WYOMING RAILROAD INC
BEEM	BEECH MOUNTAIN RAILROAD COMPANY
BFT	BIG FOUR TERMINAL RAILROAD, LLC
BGCM	BG & CM RAILROAD
BGS	BIG SKY RAIL CORP
BH	B&H RAIL CORP
BHP	BHP NEVADA RAILROAD COMPANY
BHR	BROOKHAVEN RAIL, LLC
BHRR	BIRMINGHAM TERMINAL RAILWAY LLC
BIP	BELPRE INDUSTRIAL PARKERSBURG RAILROAD
BIR	BUCYRUS INDUSTRIAL RAILROAD LLC
BIRR	BELLINGHAM INTERNATIONAL RAILROAD LLC
BJRR	BAJA CALIFORNIA RAILROAD INC
BJRY	BURLINGTON JUNCTION RAILWAY
BKRR	BATTEN KILL RAILROAD INC
BLE	BESSEMER AND LAKE ERIE RAILROAD COMPANY
BLMR	BLUE MOUNTAIN RAILROAD INC
BLOL	BLOOMER LINE, THE
BLR	BLACKLANDS RAILROAD THE
BLU	BLUE RIDGE SOUTHERN RAILROAD LLC
BM	BOSTON AND MAINE CORPORATION
BML	BELFAST AND MOOSEHEAD LAKE RAILROAD COMPANY
BMRG	BLUE MOUNTAIN AND READING RAILROAD
BNG	BLACKWELL NORTHERN GATEWAY RAILROAD COMPANY
BNML	BURLINGTON NORTHERN (MANITOBA) LTD
BNSF	BNSF RAILWAY COMPANY
BOCT	BALTIMORE AND OHIO CHICAGO TERMINAL RAILROAD CO
BOP	BORDER PACIFIC RAILROAD CO
BPRR	BUFFALO & PITTSBURGH RAILROAD INC
BRAN	BRANDON RAILROAD LLC
BRC	BELT RAILWAY COMPANY OF CHICAGO
BRG	BROWNSVILLE & RIO GRANDE INTERNATIONAL RAILWAY, LLC
BRR	BATTLE RIVER RAILWAY NGC INC
BRS	BATON ROUGE SOUTHERN RAILROAD, LLC.
BRW	BLACK RIVER & WESTERN CORPORATION
BS	BIRMINGHAM SOUTHERN RR CO
BSDA	BI-STATE DEVELOPMENT AGENCY
BSOR	BUFFALO SOUTHERN RAILROAD INC

BSR	BIG SPRING RAIL SYSTEM, INC.
BSRR	BOSTON SURFACE RAILROAD COMPANY, INC
BSVY	BOONE & SCENIC VALLEY RAILROAD
BTR	BOUNDARY TRAIL RAILWAY COMPANY INC.
BVRR	BOISE VALLEY RAILROAD, LLC
BVRY	BRANDYWINE VALLEY RAILROAD COMPANY
BXN	BAUXITE & NORTHERN RAILWAY COMPANY
CA	CHESAPEAKE & ALBEMARLE
CAEG	COFFEEN AND WESTERN RAILROAD
CAGY	COLUMBUS AND GREENVILLE RAILWAY
CALA	CAROLINA SOUTHERN RAILROAD COMPANY, THE
CAMY	CAMP CHASE RAILWAY COMPANY, LLC
CARR	CARROLLTON RAILROAD
CBC	CHEMIN DE FER BAIE DES CHALEURS INC
